Abstract (en)

Apparatus for sorting and recovering products, especially liquids such as waste motor (engine) oil, which are contained in drums, comprising a structure (1) which has a vessel (6) intended to receive the liquid, communicating with the outside via an orifice to ensure emptying of the drums and which is surmounted by a recovery tank (7) for the drums. According to the invention, it includes means for preventing soiling and dirtying of the structure (1) during operations of pouring the oil and removing the empty drums, as well as means for emptying the liquid and a filling indicator gauge (10) which is visible from the outside of the apparatus. The apparatus includes a float (16) which interacts with a closure bolt (17) when the vessel is full. <IMAGE>
