Abstract (en)  
[origin: EP0568766A1] The invention relates to a roof covering panel (1) which is fitted with baseplate (G) and dome (4) and is intended for the passage of a two-part tube (2) which reaches above the panel and can be adjusted in terms of inclination. The correspondingly dimensioned passage hole configured as a slot (L) is arranged in the top region of the dome exhibiting an upper side in the form of a cupola and, on the tube (2), there is seated a hood part which is of appropriate shape, rests on the upper side of the dome (4) and above which there is located a coupling point which connects the upper tube part to the lower tube part. Securing of the hood part resting on the dome (4) is effected by bearing noses (12) which are located in the region of the underside of the roof covering panel (1) and engage in each case into a pivot-pin groove (11) in the inner surface of the side walls (4') of the dome (4). In order to achieve a design which is favourable for mounting, the invention proposes that it be possible to angle the bearing noses (12) into the interior, which is closed off towards the bottom, of the pivot-pin groove (11). <IMAGE>
