Abstract (en)
[origin: EP0568813A1] The invention relates to a structural element for heat insulation between a building and a projecting building part by means of an insulating body (1) which is to be laid therebetween and has integrated reinforcing bars (2, 3) which are provided with an anti-corrosion coating. In order to protect this coating from wearing away locally on the building site, the reinforcing bars are each pushed, in a hazardous area, into a tube (4, 5) which retains the reinforcing bar (2, 3) by inwardly projecting protrusions (4a, 5a), thus forming an annular gap (6), and has a multiplicity of openings (4b, 5b) in the tube wall in order that concrete slurry can penetrate into the annular gap (6) and fill the same. <IMAGE>
