Abstract (en)

[origin: EP0570133A1] A styrene resin composition comprises a crosslinked styrene resin and, uniformly dispersed therein, an uncrosslinked resin capable of being extracted with an organic solvent and present in an amount of 3 - 50% by weight of the total composition. A molding is produced from the composition by cast polymerizing a liquid mixture comprising by weight, based on the total amount of ingredients (a), (b) and (c): (a) 30% or more of styrene monomer; (b) less than 70% of a monofunctional monomer having one radical-polymerizable double bond; (c) 0.01 - 40% of a polyfunctional monomer having at least two radical-polymerizable double bonds; (d) from 3 - 100 parts of a resin component soluble in a mixture of (a), (b) and (c); and (e) from 0.001 - 5 parts by weight per 100 parts by weight of the total amount of (a), (b), (c) and (d) of a free-radical polymerization initiator.
