Abstract (en)
[origin: EP0570334A1] A folding jaw cylinder for a printing machine has a folding jaw arranged rotatably on the cylinder, a stop for the folding jaw, a rotary body which can be connected fixedly in terms of rotation to the cylinder and whose angular position is adjustable relative to the cylinder, and a gear mechanism for adjusting an operating distance between the folding jaw and the stop by adjusting the angular position between the cylinder and the rotary body. In this case, the stop is arranged movably on the cylinder and, during the adjustment of the angular position between the cylinder and the rotary body, is adjusted relative to the cylinder by an adjusting means which is linked to the rotary body and attached to the stop. <IMAGE>
