Abstract (en)
The subject of the invention is a device for dispensing products which are more or less fluid, formed by a container having a cylindrical body (one end of which is provided with a movable bottom and the opposite end of which is capped by a dispensing pump shell), one end of which is provided with a movable bottom and the opposite end of which is capped by a dispensing pump having an axial connector and mounted on a plunging sleeve (4), the front face of which penetrates into the neck (1b) of the container (1) when fixing the dispenser subassembly (4/5/6), which ends up, upon sealed sliding, being placed entirely beneath the upper edge of the corresponding bearing surface of this neck. This simplifies filling and air purging.
