Abstract (en)
[origin: WO9211946A1] The invention relates to a degreasing device for mass-produced items with a drum which can be rotated and driven about a vertical axis and has an upper loading aperture. The invention is designed to improve the degreasing process in such a way that it not only takes less time but entails lower material costs. This is achieved in that the casing (15) of the drum (14) is perforated (16), the drum (14) is surrounded by a stationary catching ring (25) having a peripheral groove (26) projecting inwards at the bottom and fitted with an outflow (28) and the drum (14) has a central aperture (18) in the base which can be closed by a raisable cover (19).
