Abstract (en)

[origin: EP0571763A1] The present invention relates to a piste ski specially adapted for participating in slalom skiing, which comprises a central bearing downstream part (10) ending in a front contact line (12), beyond which extends, in the tip zone (2), a raised upstream part (11) on which is attached a non-symmetrical counter tip device (end piece) (3) for the tip, which extends it via a central part (4) having the general shape of a horn, the end (34) of which is offset towards the inside of the ski (INT) relative to the median longitudinal axis (I,I'). The counter tip device comprises an overhanging lateral part (5) connected to the said central part and forming a skirt on the side of the outer edge of the ski, and the upper surface (50) of which is intended to enter into contact with the slalom pole. The invention also relates to the deflector counter tip device intended to be attached to a ski. The invention makes it possible for the end of the ski to remain in permanent contact with the snow even in the event of contact of the skirt (5) with a slalom pole (24). <IMAGE>
