Abstract (en)

A door has a door leaf (1) which can move into the closed position and the open position. The door leaf (1) is subdivided into a plurality of segments (1a, 1b, 1c, 1d) which are coupled to one another in an articulated manner. The segments (1a-1d) are guided outside the through-passage area (20) of the door such that they depart from the plane of the door leaf. Provision is made, in particular, for the door-leaf segments to be wound or folded. <IMAGE>
