Abstract (en)

[origin: EP0572317A1] The connection terminal of the invention consists of an insulating case (62) comprising housings for receiving metal contact elements (50). Each housing consists of a cavity (63), extending a generally U-shaped recess (64) consisting of a bottom (69) and two side walls (70). Each contact element (50) comprises a plug-in part (51) penetrating into one of the cavities (63) and a part (52) for connecting an electrical conductor, the connection part (52) being held in the recess (64) of the housing by means of a pin (stud) (58) which penetrates into a slot (65) made at the base of the side wall (70). The connection parts (52) each have a hollowed-out portion (61) in the region of their pin (58) so that a minimum distance between contiguous contact elements (50) is preserved. <IMAGE>
