Abstract (en)

[origin: US5209565A] An assembly for the mixing of two different products stored separately. The assembly comprises a first and second container, the first container having a neck and a body. The neck of the first container having a tearable cap and the body being responsive to manual pressure to effect the dispensing of the product from the first container after the cap is torn. A rigid second container has a neck to which a first cap is attachable. The first cap has an attachment member for cooperating with the neck of the first container and an opening extending therethrough. A removable second cap is attachable to the first cap to close the opening. The first cap has a perforating member surrounding its opening so that when the first container is attached to the second container, the perforating member perforates the tearable cap of the first container to allow mixing of products stored in the first and second containers after removal of a protective stopper on the first container and removal of the second cap of the second container.
