Abstract (en)

Support device (1) for limiting the flexibility of bedsprings and mattresses comprising a pair of substantially parallel stringers (2,3) mutually spaced by elastically flexible plate-like elements (4) interposed between the pair of stringers. The support device furthermore comprises tension elements (5) which are transversely associable with the stringers by means of their longitudinal ends and can be tightened to reduce the distance between the stringers and cause the flexing of the plate-like elements. The support device can be placed between a bedspring and a mattress so that the stringers are orientated parallel to the longitudinal extension of the bed and so that the plate-like elements flex upwards so as to limit the sagging of the bedspring and of the mattress during use. <IMAGE>
