Abstract (en)
[origin: EP0574654A2] An adjustable setting-out device for left-closing and right-closing turn-and-tilt or tilt wings, especially for wings of windows or doors, comprises a scissor-type bearing which is designed for receiving a tenon-shaped end of a setting-out arm. The scissor-type bearing has a rotation limitation for limiting the angle of rotation between the scissor-type bearing and setting-out arm by means of at least one projection and two stops and can be adjusted in the longitudinal direction relative to the setting-out arm via a fastening part, especially a screw or nut. The complete escape of the tenon-shaped end of the setting-out arm from the scissor-type bearing is prevented by a limiting device. The limiting device is made from a harder material than the scissor-type bearing. <IMAGE>
