Abstract (en)

[origin: EP0575119A1] A restrictor device (1) for an opening wing (2) of a window, door or the like comprises a link (20) pivotally connected to a base plate (17) for securing to the wing (2) and an arm (9) pivotally connected to a mounting plate (6) for securing to a surrounding fixed frame (30). The arm (9) and link (20) are coupled to restrict opening of the wing (2) and can be uncoupled when the wing (2) is closed to release the restrictor device (1) allowing unrestricted opening of the wing (2). The mounting plate (6) and base plate (17) are located relative to each other on closing the wing (2) by co-operating formations (22,23;24,25) so as to align the uncoupled arm (9) and link (20) for automatic re-coupling to re-set the restrictor device (1). <IMAGE>
