Abstract (en)
[origin: EP0576832A1] A training apparatus, particularly for skiers, having at least two mutually assigned, flat discs (8) which are driven in opposite directions and between which the skier can pass in order to simulate wedeln or parallel turning. The discs may be inclined relative to the horizontal and be adjusted in height in order to simulate unevennesses of the skiing piste. A plurality of pairs of discs can be arranged in one plane, and the plane may be inclined, such that it can be adjusted, with respect to the horizontal. The invention provides apparatuses for avoiding the risks of a fall (fence, rope suspension for the skier who is training). <IMAGE>
