Abstract (en)
[origin: EP0576851A2] The invention relates to a roller-blind casing with a three-sided or four-sided screen profile. In each case one head piece is arranged at the free ends of the screen profile. Openings for receiving the ends of the roller-blind shaft are made in said head piece. The characterising feature of the invention is that the head piece (1) comprises an injection-moulded part which is in the form of a plate and consists of polymeric material. On the casing side, the head piece has a peripheral edge comprising reinforcing ribs (21, 22, 23) which are offset with respect to one another. Said reinforcing ribs (21, 22, 23) project out of the plate-shaped base (11) and are connected to one another via connecting webs (24, 25). The reinforcing ribs (21, 22, 23) delimit a two-dimensional receiving space (12) for an insert piece (3).
