Abstract (en)  
[origin: EP0577859A1] In the case of a keyboard comprising individual keys (T), said keys are surrounded by frames (R) which are supported with respect to the printed circuit board (LP) and the front panel (FP) of the keyboard. A sealing film (DF) like a drum skin is clamped between the front panel (FP) and the frame (R). The sealing film (DF) is in this case used for sealing and exerts a restoring force on the actual operating elements (TK). In consequence, a keyboard which is suitable for industrial application can be implemented in an extremely simple manner (extremely easily).
