Abstract (en)

[origin: EP0467783A1] The method makes it possible to control the movement of a swinging load suspended from a support which is horizontally mobile and moved from a departure point to an arrival point during a journey of predetermined duration (T). The movable support (40) is subject to a support movement law  $x(t)$  determined such that the movement of the swinging load (20) is regulated by a load movement law  $X(t)$  satisfying the following conditions:  $X''(t)$  is continuous and derivable according to the time variable  $t$ ,  $X''(t) = 0$  and  $X'''(t) = 0$  for  $t >= T$ . Use especially for port lifting engines such as cranes, gantries for buckets or for containers. <IMAGE>
