Abstract (en)

Prismatic units are described for use in advertising panels with rotating elements, which are constituted by a straight equilateral triangular structure formed, for each unit, by three mobile hollow prismatic modules in the form of a straight isosceles triangular prism. These modules are aligned side by side along the smaller lateral faces and are fixed with two stoppers which each have three graftable inserts at the two ends in the hollow parts of the said modules. On each stopper is a connection for linking it to the anchorage system on the panel frame or the device for transmission of the rotating movement of the various triangular prismatic units of the panel. The use of these modules allows rotating units to be prepared without an internal support and therefore is much simpler and cheaper than those currently available. <IMAGE>
