Abstract (en)
[origin: EP0580883A1] A closure comprises a cap part (1) which can be fixed on the mouth end of a container and in whose dimensionally stable bottom wall (9) a sealing arrangement (11) with a sealing cone (13) is held by a flexible wall region (12) in such a way that the sealing cone (13) can be moved into and out of a sealing engagement with a mouth opening (5) of the container. Means, for example in the form of a fold-over of the flexible wall region (12), are provided in order to hold the sealing arrangement (11) in the end positions which correspond to the release and closure positions of the sealing arrangement. The sealing arrangement (11) can be moved by hand into the end positions by means of a moulded-on actuating part (15). A pouring element (16) can be moulded onto the flexible wall region (12) so that it undergoes pivoting corresponding to the respective position of the flexible wall region (12) during the movement of the sealing arrangement (11) between the closure and release positions.
