Abstract (en)
[origin: WO9219117A2] A sports boot has a lower part comprising two sections (1a, 1b) which move relative to each other and a front shaft (2) and a rear shaft (3) which are interconnected by at least one joint (4) in such a manner that they move together. The movable sections (1a, 1b) of the lower part can be fastened by an actuating device (9). A mobile actuating element (6) is arranged in the region of the lower part next to the rear shaft (3). The actuating element (6) is connected to the rear shaft (3) via a holding device (10) arranged on a spring device (22) on the rear shaft (3). The actuating element (6) is connected to the actuating device (9) in such a manner that when the actuating element (6) or the actuating device (9) is actuated both the shaft (2, 3) and the lower part (1a, 1b) are simultaneously fastened or unfastened. The actuating element can be connected to the spring device via a holding device (10) on the spring device in the form of a holding bar which automatically locks the shaft when the actuating element, which is preferably a rear flap, engages therein, and is connected via a connecting rod or a Bowden cable to the adjusting element (9).
