Abstract (en)
[origin: EP0582119A1] According to the prior art, it is known to connect tagboards (10) of loudspeakers to the loudspeaker frame by riveting. It is also known to strain-relieve connecting cables, which are connected to the tagboard (10) and a signal source, at the loudspeaker. According to the prior art, this is mostly achieved in such a manner that the connecting cable is pressed against the magnet system of the loudspeaker by means of a so-called cable tie. It is also known to clamp in the connecting cable between a lug formed at the loudspeaker frame (12). To simplify production, it is specified to provide the tagboard (10) with locking hooks (13) which securely hold the tagboard (10) at the loudspeaker frame (12) after it has been connected to the web (11). The strain relief for the connecting cable (22) is achieved in such a manner that a locking latch (18) can be inserted into openings (16) of the tagboard (10). Once the locking latch (18) has found its final position on the tagboard (10), the locking latch (18) interlocks with the tagboard (10). The shaping of tagboard (10) and locking latch (18) matches in such a manner that, when the locking latch (18) has found its final position, a connecting cable (22) inserted between these two components is clamped in. This achieves effective strain relief in the area of the tagboard (10). <IMAGE>
