Abstract (en)
[origin: EP0582545A1] In a spinning apparatus, especially a ring-spinning machine, for winding a thread or the like on to a tube (2) seated on a spindle shaft (1) having an underwinding crown (15), which is arranged in a wharve (7), a sliding sleeve (9) having an inner flange (9) and an outer flange (16) is to engage around the wharve (7). At least one projection (21) of an actuating member (6) strikes the outer flange (16) and moves the sliding sleeve (9) counter to the force of a spring (10) located between the inner flange (12) and an annular edge (11). The underwinding crown (15) thereby moves either out of or into a receiving recess (14) above the inner flange (12). The outer flange (15) is at the same time to be assigned a wearing ring (17) which the at least one projection (21) strikes. <IMAGE>
