Abstract (en)

[origin: EP0583184A1] Process for controlling the rotational speed of an internal-combustion engine in idling mode, characterised in that it comprises the following steps: - periodically measuring the value of the battery voltage; - deducing therefrom a mean value of the battery voltage over a given horizon; - calculating the value of a statistical amount representing the discrepancy between each mean value of battery voltage and a predetermined threshold value; - associating, with each value of the said statistical magnitude, a corresponding value of the rotational speed of the engine in the idling mode. <IMAGE>
