Abstract (en)
[origin: WO9318257A1] Energy supply device for an electric or electronic lock (4), in particular for a cylinder lock. An electric energy generator (5, 7) or a mechanical actuator for such a generator is arranged in the lock (3, 4) and can be brought into mechanical and/or electromagnetic operational contact with the key (1), when the latter is inserted in the axial direction of the lock. It thus becomes possible to ensure for electronic locks a reliable long-term autonomous operation, i.e. independent of outer supply, so that consequently an exclusively electronically coded lock can be designed.
