Abstract (en)
[origin: EP0583761A1] An umbrella is described which has a handle (1) which is attached at an upper end part (3) of the umbrella stick (2) via a joint (4) such that it can be swivelled between a position, which is at least approximately flush with the direction of the stick axis, and a position which is angled preferably by about 90 DEG relative to the stick axis. The end part preferably has the same diameter as the adjoining gripping region of the handle and serves as an extension of the gripping region. An attachment shell can be attached in the gripping region of the end part, which attachment shell allows comfortable and secure holding of the umbrella. <IMAGE>
