Abstract (en)
The connector may be moulded of resilient plastics or formed of springy metal and includes a plug-in portion of substantially U-shaped transverse cross section. The limbs of the plug-in portion are arranged to co-operate with the walls of the spacer bar 1 to be deformed inwardly and thus provide an interference action which retains, or assists in retaining, the connector within the spacer bar. The free ends of the two limbs may be chamfered to co-operate with inclined shoulders 2, 3 of the spacer bar, and an internal space 26 is formed within the connector to allow the passage of desiccant.
