Abstract (en)

[origin: WO9317948A1] The invention relates to a textile machine with a device for recognising and correcting irregularities in the movement cycle of a component (31) operated by a driving unit (33). A device (51) detects the arrival time (t4) of the driven component (31) and corrects the starting time (t1) of the driving unit (33) within a predetermined time range (t1u-t1o) until the arrival time (t4) of the driven component (31) once again lies within a predetermined time range (t2u-t2o).
