Abstract (en)
[origin: WO9220258A1] Into a frame (1) having a supporting edge (10), in particular a continuous supporting edge, oriented towards the inside of the frame, is inserted a board (2), in particular a table top, that corresponds to the form of the frame. The support of the board in the frame corresponds to the form of the boards and the board rests exclusively on the supporting edge (10) of the frame. By providing the frame with at least three legs, a table is obtained. The frame with the board may also be laid on consoles or the like or be used as an intermediary board between two such tables. The board is retained in the frame by its own weight. In order to secure it further, however, against falling out or removal, the board (2), in particular a table top, carries an elastic, locking member (12), which can be opened, on at least two approximately opposite edges (11) or edge parts. The locking member (12) grips from below an inner projection or inner edge (16) of the frame that faces the edge (14) of the board and may be brought to its release position by a displaceable actuating member held on the frame (1).
