Abstract (en)

[origin: EP0585741A2] In order to retain and tension flexible, cloth-like material, in particular for large-surface-area structural parts, without said material folding, use is made of individual parts which can be displaced relative to one another and the displacement of which results in the tensioning of the flexible structural part. For this purpose, tensioning elements for carrying receiving profiles for the flexible structural part are fastened on a rigid rear wall, said elements being distributed over the length of said wall while maintaining the distances between them. <IMAGE>
