Abstract (en)
[origin: EP0586029A1] The invention relates to a lifting apparatus with a lifting device, by which a load-suspension means connected to the lifting device via a draw means can be lifted and lowered, and a control device which is connected to the load-suspension means and consists of a housing, a handle for manipulating the load-suspension means, and operating elements which are arranged in the housing and, for controlling the lifting device, can be actuated by pressure elements which are arranged in the housing, are inclined relative to the handle and can be reached by the thumb of a hand grasping the handle. In order to obtain easy-to-operate and therefore also reliable manipulation of the control device in a lifting apparatus of this type, in particular if the control device is in an extreme position with regard to the load, it is proposed according to the invention that the handle (6) be curved, its curvature being selected in such a way that the outside (6a) of the handle (6), in imaginary extension, intersects the pressure elements (operating rocker (21)) in the area of their bearing surfaces (25). <IMAGE>
