Abstract (en)
[origin: WO9220413A1] The stick according to the invention is characterized by an especially reliable locking device comprising a locking collar (10) which screws onto the threaded part (9) of an end piece (7) forcibly engaged in the inner end (4) of a tubular section (2) of small diameter. The latter section (2) of small diameter and the locking collar (10) axially slide in a tubular section (1) of large diameter. The latter section of large diameter (1) and the locking collar (10) are shaped so as to prevent any mutual rotation of the locking collar (10) in the first tubular section (1). Once fastened by screwing, the locking collar (10) contacts a conical part (8) which causes the former to expand and forces it against the inner wall of the first tubular section (1), thereby axially blocking the tubular elements in relation to one another.
