Abstract (en)

[origin: EP0587527A1] Into tubular packages (P) which contain an imbricated formation (1) of flexible, sheet-like articles, in particular printed products, and which are covered by a protective/holding element (3) there can, according to the process of the invention, be positioned a supplementary product (2) such that, with the individual removal of printed products from the interior of the package, it is removed first. This is achieved in that, before the winding operation, the supplementary product (2) is assigned to the imbricated formation (1) on the side of the latter which is concave in the reel and in the region of the edge of the imbricated formation (1) which is leading in the winding operation and the supplementary product (2) is then wound together with the imbricated formation. <IMAGE>
