Abstract (en)
[origin: EP0588186A1] To provide a slide for a drawer, which can be pulled out of a body, comprising a body-side guide rail (16) and a guide rail (18) which is mounted thereon so as to be displaceable by means of rolling elements and can be connected to the drawer, and also push-in dowels (22) which are arranged on the body-side guide rail at a distance from one another in the longitudinal direction thereof and protrude from a bearing side of the body-side guide rail with defined alignment, in such a way that a connection, less susceptible to wear, between the body-side guide rail and the push-in dowels exists, it is proposed that in a mounted position of both push-in dowels the body-side guide rail is displaceable in its longitudinal direction with respect to the front push-in dowel, and the rear push-in dowel limits the displaceability of the body-side guide rail in the pull-out direction, and that in the mounted position the body-side guide rail is held substantially immovably on both push-in dowels transversely to its longitudinal direction. <IMAGE>
