Abstract (en)

[origin: EP0588272A1] In a device for emptying large-capacity containers, whereby the weight of the large-capacity containers can be determined with little or no measuring error, each pivot arm (6a, b) has a first arm part (9a, b) articulated on the collection container (2) and a second arm part (12a, b) carrying the receiving device (17a, b), the second arm part (12a, b) at least partially receiving the first arm part (9a, b) within itself and at least two measuring sensors (22-25) being arranged in the second arm part (12a, b), on which two arm parts (9a, b, 12a, b) in each case are fixed. On each measuring sensor (22-25), at least one measuring element (40a - d) is arranged in such a way that the measuring direction (41) of the measuring element (40a - d) coincides with the vertical for a predetermined pivot angle $s > 0$ of the pivot arms (6a, b). All measuring sensors (22 - 25) are connected to a common weight evaluation device (45). <IMAGE>
