Abstract (en)

Apparatus for connecting two mutually crossing cable portions (2, 3) at respective intersections (17) of a netting formed from one or more cables, with two wires to be wound around the cable portions at the intersections, comprises two hollow wheels (4, 5) which are driven about a common axis (DA) in mutually opposite directions, with wire receiving means (20, 21) for the wires (12, 13), which are mounted in cavities in the drive wheels (4, 5) displaceably in mutually opposite axial directions and are non-rotatably connected to the drive wheels (4, 5). The two hollow wheels (4, 5) are rotatably mounted on a frame (1, 6, 7) and are driven by a common drive means (8-10, 14). <IMAGE>
