Abstract (en)
[origin: EP0589089A1] There is a device, in which rotary bearings 6, each for a cloth bale 16, are mounted on an undercarriage 3, a removal of a cloth web 22, 23, 24 from each of the cloth bales as a result of the rotation of the cloth bale about an axis of rotation 7 is provided, a to-and-fro displaceability of the cloth bale 16 in the direction of the axis of rotation is provided, and a feed of the cloth webs 22, 23, 24 to the low-layer cutter is provided. At the same time, it is desirable to have a device which removes the cloth web from the cloth bale in a driven manner and which carries out the lateral displacement of the cloth bale in a driven manner, specifically along with a simple design and with the cloth being treated carefully. This is achieved in that each rotary bearing 6 is designed as a trough with a drivable 19 conveyor wall 15, and in that each trough-type rotary bearing 6 is provided on a trough carriage 8 which is displaceable to and fro in a driven manner 13 in the direction of the axis of rotation 7 on the undercarriage 3. <IMAGE>
