Abstract (en)
[origin: EP0589308A1] In a hearing aid having at least one switching means as on/off switch, as multifunction switch, as volume step switch, as situation change-over switch or the like, it is proposed, for extending the function of an existing switching means and for saving separate further switching means, that a switching means (10) exhibits, apart from at least one defined switch position (M, T), at least one further unstable switch position (S) from which the switching means can be automatically reset into the defined switch position (M or T) after triggering a switching process.
