Abstract (en)

[origin: EP0589388A2] A method and a device for the treatment of a web material are specified, in which a closed loop (12) is formed from a section of the web material (13), the web material is moved in the circumferential direction of the loop and the web material is treated in various environmental conditions. In a method of this kind and a device, the conditions of an actual production plant are simulated as realistically as possible or relatively small amounts of a product consisting of web material are produced under exactly predeterminable treatment conditions. For this purpose, the loop (12) is moved transversely to the circumferential direction through the various environments. <IMAGE>
