Abstract (en)
[origin: WO9222693A1] The invention concerns a yarn storage and feed device (1, 1', 1'') with a main body (4), a take-up element (9) on which the yarn (Y) is wound, a surface (17) for yarn storage (V) and a threading device with a compressed-air feeder system and a device for activating direction-jet nozzles (32, 33, 33', 35, 37, 37', 73). At least one direction-jet nozzle (32) located between the point of entry (Z) of the yarn into the storage and feed device and the feed-out point (11) from the yarn-winding element (9) can be activated independently of the nozzles fitted between the feed-out point (11) and the guide (22), in order, in the event of a partial failure with stored yarn (V) remaining on the storage surface (17), to be able to blow the yarn end to below the feed-out point (11).
