Abstract (en)

[origin: EP0590381A2] In this method, reference signals are obtained from measurement signals of the measurement probe which represent a physical characteristic of an acceptable coin, which reference signals are stored in a programmable memory of the coin tester, at least one measurement signal being generated with the aid of a calibration module introduced into the channel section containing the measurement probe and a calibration factor being calculated from the measurement signal for the purpose of determining the specific reference value for the respective coin tester. <IMAGE>
