Abstract (en)

[origin: WO9105155A1] The proposal is for a process and device for controlling the air supply to an internal combustion engine of a motor vehicle in which filtered values for regulating the position of the setting component are generated from the predetermined values formed dependently upon operating parameters of the internal combustion engine and/or the motor vehicle as values to be filtered and the rate of change of the setting component position as dictated by the filtered values and those to be filtered, especially their difference, can be changed by acting on the filter characteristic or the transmission behaviour.
