Abstract (en)  
An electric fence wire construction having a supporting structure and a plurality of filaments (6) of electric current-conducting material. At least one group of the filaments (6) of conducting material is intertwined into a strand (5). Forces exerted on the filaments (6) of conducting material are distributed more evenly over said filaments and the conducting filaments cut less into the supporting structure. Further, the conducting filaments (6) may be relatively thin, thus reducing the susceptibility to fatigue due to repeated bending and further promoting the working life. <IMAGE>
