Abstract (en)

[origin: EP0592336A1] Connection terminal for electric power equipment, comprising a cage (2) and a screw (5). The terminal comprises: a moving contact part (7) forming a cable housing (9); a compression spring (14) arranged in a space separating an internal wall (15) of the cage from an external wall (13) of the moving contact part, so as to push the moving contact part (7) elastically, in such a way that the actuation of the screw in the direction which causes the movement of the moving contact part, by the spring relaxing, brings about the gripping of the cable between the moving contact part (7) and the fixed contact surface (11), the gripping force being provided by the elastic force of the spring. <IMAGE>
