Abstract (en)

[origin: EP0592893A1] An engineering brush with an endless flexible bristle carrier which preferably rotates via appropriate guides or deflection elements and onto which individual bristle bodies are fitted, which form a generally continuous brush surface in the straight regions outside the deflections, is distinguished by the fact that an essentially standardised roller chain "K" serves as a carrier for the bristle bodies 1, on the side surfaces "KS" of which roller chain are arranged pins "Z" or the like onto which the bristle bodies 1 are fitted via corresponding clamping slots 2, catch openings or the like in the groove walls (1b), one pair of pins "Z" being provided for each bristle body (1) and said pins "Z" being arranged by means of continuations of the connection axes "A" of a chain link K2 on both sides towards the two adjacent links K1 to K3. <IMAGE>
