Abstract (en)

[origin: EP0593395A1] The spreading device is intended for a spreading and binding machine on which a plurality of immovable spreading fingers are laterally arranged and interact with the spreading hooks of a displaceable rake, in order to move the spreading hooks away from the spreading fingers in the spreading direction by displacement of the rake. The rake (61) is connected via two rotatable and movable arms (65, 67) to a bar (63) which is mounted in such a way that it can move both in the spreading direction (A) and in a direction perpendicular to the spreading direction, in a parallel movement. The bar (63) is connected in an articulated manner to two further arms (64, 66). <IMAGE>
