Abstract (en)

[origin: WO9323930A1] A selective call receiver (30) receives personal messages and information services. A memory (44) stores the personal messages and the database messages. A display (42) displays the plurality of screens. The user can display screens manually through activation of user input controls (40). Alternatively, the user can display selected screens in a quick access or quick view mode by placing operation of the receiver (30) under the control of a quick view controller (60) coupled to the database portion of memory (48). The user can selectively flag a screen (fig. 9) or trigger a numeric field of a screen (fig. 16). When database messages are received which update a flagged screen or triggered screen, the flagged or triggered screen automatically becomes one of the selected screens for display in the quick view mode.
