Abstract (en)  
[origin: US5505957A] A transdermal drug delivery system is disclosed. The system comprises a laminate composite of a patch/skin permeable membrane; a transfer gel layer disposed on said permeable membrane; a permeable membrane disposed on said transfer gel layer; a plurality of sectional drug reservoirs for receiving medicament disposed on the transfer gel layer; and activation means for releasing medicament from said drug reservoirs for contact with skin of a patient. The medicament is contained in the reservoirs at varying amounts and/or concentrations, providing for selectable dosage, for sequential delivery, for sequential activation, for variable unit dose drug delivery in transdermal application.
