Abstract (en)
[origin: EP0593893A1] The present invention relates to a rotating tool for working the ground, having a cylindrical envelope (2) in whose circumferential region at least one axially extending scraper (4, 14) acts, the envelope (2) being equipped, at its surface, with axially spaced projections (3) for local ground-compaction. The essential feature of the invention lies in the fact that the scraper (4, 14), in relation to a radial section through the rotating tool, is profiled approximately in the manner of a spoon at its end (4b, 14b) facing the envelope surface and terminates on the envelope surface (2) virtually tangentially opposite the direction of rotation of the tool. <IMAGE>
