Abstract (en)

[origin: EP0594057A1] With the present invention, a device is proposed which permits the brake block of a vehicle brake to be lifted off uniformly from the braking surface of the vehicle wheel to be braked, in particular if the brake is released. As a result, uniform wear of the brake blocks (2') is ensured. The parallel guidance of the brake block shoe (2) is brought about by a parallel connecting rod (5) according to the invention, the length of which parallel connecting rod (5) is infinitely adjusted in accordance with the position of the vehicle wheel after a specific frictional force has been overcome, and is kept in this position until re-adjustment is performed. <IMAGE>
